

FairFit

Hiring screening for humans, not keyword filters.

Track 1 • Recruiting operations

Built with OpenAI Agents SDK + Codex

100% synthetic data

Recruiting is broken at the top of the funnel

Thousands

of applicants per role, impossible to read fairly by hand.

Auto-reject

keyword ATS filters discard strong people for the wrong reasons.

Black box

no reason, no second look, no human judgment.

Reading a CV against what the role actually needs is exactly where an agent helps a recruiter.

Understand the role, screen fairly

1

Role

Brief into must-haves and nice-to-haves.

2

Screen

Each CV, past keywords, without bias.

3

Shortlist

Favorable / Medium / Unfavorable, with reasons.

Guardrail: it surfaces and explains candidates — it never auto-rejects.

WHAT THE JUDGES SEE

Drop CVs, get a human-readable shortlist

Three clear tiers

Why to dig deeper, why a maybe, why to set aside.

Every reason shown

Strengths, gaps and which must-haves are met or missing.

CV one click away

Open the full CV, or draft an invite / info request / kind rejection.

Faster screening, fairer outcomes

Minutes

to a reasoned shortlist from a stack of CVs.

Fair

judged on capability, not name, age or background.

Human

a person always makes the final call.

Scale: Any role or seniority; bring your own CVs and your own definition of fit.

Screen like a human, at scale.
